

# How a bee sees

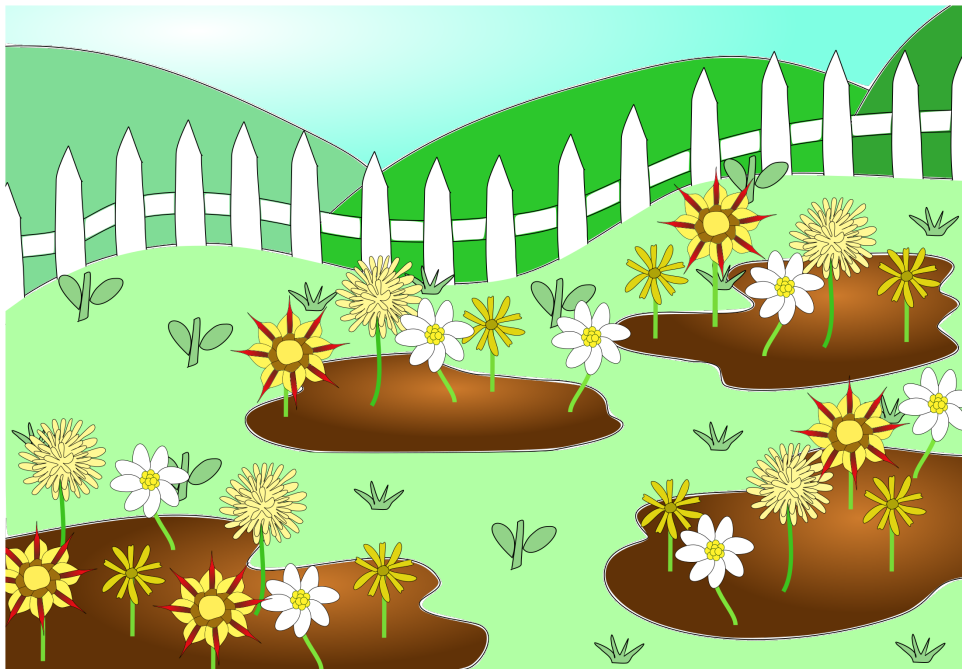

This document summarises the information found in the interactive image it accompanies.

## Introduction

Bees see colours a bit differently to us; they do not see the colour red, but they can see 'UV' light, which humans can't see without a UV lamp. UV lamps are the blue lights used by police to see evidence at a crime scene.

Below, there are two images of a garden (with annotated descriptions). One image shows the garden as a human would see it, and the other image shows the garden as a bee would see it.

## Human view of the garden

## Bee view of the garden
